HDPE PIPE MARKET Size, Segmentation, Applications and Opportunities

All About the HDPE Pipe Market – Size, Segmentation, Applications and Opportunities

What started as a new and exciting innovation in the piping world has expanded to be one of the most highly sought-after solutions for water and gas distribution. With over fifty years of history, HDPE pipes have made a name for themselves as effective and cost-efficient piping solutions. Made from durable high-density polyethylene, HDPE pipes are some of the toughest and most reliable around.

No wonder, then, that the HDPE pipe market is expected to grow at a CAGR of 5% from 2022 to 2030, to reach \$22 billion. Given the right set of circumstances, HDPE pipes can last for centuries without any significant deterioration. In fact, several water distribution systems worldwide are still using HDPE pipes that were put into use before 1980. These are impressive numbers for a product that was only commercialized in the 1960s.

HDPE Pipes Market Segmentation

The global HDPE pipes market can be segmented based on geography, distribution channel, and material. More granularly, the market's segmentation into product types, applications, and end-use industries is essential. It's noteworthy that HDPE pipes are available in different strength variants, with PE80 and PE100 being the most commonly used.

HDPE Pipes – Geographic Analysis

The APAC region, as it stands, is touted to be the largest market for HDPE pipes during the forecast period.

Making things out of plastics is like playing a game with molecules. The aim is to re-organise them into new shapes without their changing colour, sticking to the mould, or doing anything that could spoil the finished article. Additives help with all these problems. In fact, processing plastics without additives is virtually impossible. Consider the range of plastics available and the wide variety of plastic objects in every day use. From fizzy drinks bottles and carrier bags to window frames and computers, it is clear that there are many different ways of forming plastics. Most of these processes involve melting polymer powder or granules inside a heated tube. This 'melt' is forced through a shaped die, injected into a mould, or rolled or blown into flat film.

LITHIUM ION BATTERY ASSEMBLING UNIT

A lithium iron phosphate (LFP) battery is a type of lithium-ion battery that is capable of charging and discharging at high speeds compared to other types of batteries. It is a rechargeable battery consisting of LiFePO_4 as its cathode material; hence the name.

Lithium iron phosphate batteries have several distinctive features, including:

- Better power density
- Low discharge rate
- Flat discharge curve
- Less heating
- Higher number of charge cycles
- Increased safety

Lithium iron phosphate (LFP) batteries are also known as lithium ferrophosphate batteries.

The first model of the lithium iron phosphate battery was made after the discovery of phosphate as a cathode material for use in li-ion batteries in 1996. Improvements in the coatings and usage of nano-scale phosphate have made this type of battery more efficient.

The major distinction that lithium iron phosphate batteries have from other li-ion batteries is that LFP is capable of delivering a constant voltage and also has a comparatively higher charge cycle, in the range of 2000-3000. LFP batteries are environmentally safe and structurally stable. They have a lower energy density and low discharge rate. They do not heat up easily and are relatively cooler than other batteries. The chemistry of the battery saves it from thermal runaway, and hence it is considered to be safe for home use.

EPOXIDIZED SOYABEAN OIL (SECONDARY PLASTICIZER) USED IN PVC COMPOUND

Epoxidized soybean Oil (ESO) is an additive to flexible Polyvinyl Chloride (PVC) that gains its name from the reaction that occurs with the unsaturated soybean oil. The epoxidation reaction takes place at a carbon to carbon double bond site. The oxygen atom (usually in the form of a peroxide or a peracid) comes in and attaches itself between the two carbons to create a single bonded triangular ring between the three molecules called an oxirane. This oxirane can be used as a way of separate well formed ESO molecules from those that will be less effective. Those ESO molecules with higher oxirane percentages will product better results than those with low oxirane percentages.

Because epoxidized soybean oil is synthesized from the bio-based, renewable resource of soybean crops, the level of saturation of the soybean oil and ultimately the oxirane value of the ESO created from it, is dependent on the growing conditions of the soybeans. Very hot, dry weather is known to inhibit the formation of the unsaturated C18-3 and C18-2 double bonds in the soybean oil and will therefore lead to lower oxirane values in the ESO produced from it.

VEHICLE SCRAP YARD

Some important definition regarding scrapping of vehicle

1. Authorized Vehicle Scrapping Facility (ASVF): means any establishment which holds an Authorization for Vehicle Scrapping issued under these guidelines for carrying out dismantling and scrapping operations.

2. The RVSF Rules formally introduce, inter alia, the concept of "Registered Vehicle Scrapping Facility" ("RVSF"), "Registered Scrapper" and "Scrapping".

Registered Vehicle Scrapping Facility: Registered Vehicle Scrapping Facility shall mean any establishment engaged in dismantling and scrapping operations of the vehicles and registered with the designated registration authority for the purpose. The aforementioned designated registration authority shall be Commissioner (Transport) or any other officer designated by the government of the state or union territory, which shall issue 'Registration for Vehicle Scrapping' upon registration of such establishment.

3. "Scrapping yard" means the designated location within the premises of the RVSF where End-of-life vehicle is processed.

4. "End of Life - Vehicles (ELV)" refers to all vehicles which are no longer validly registered; or declared unfit through Automated Fitness Centers or their registrations have been cancelled under Chapter IV of the Act; or due to an order of a Court of Law; or are self-declared by the legitimate registered owner as a waste vehicle due to any circumstances that may arise from fire, damage, natural disaster, riots or accident etc., or any other reason at the discretion of the owner.

HYDROCHLORIC ACID PRODUCTION

Hydrochloric acid, also known as muriatic acid, is an aqueous solution of hydrogen chloride gas. At room temperature, it is a colorless gas, which forms white fumes of hydrochloric acid upon contact with atmospheric humidity. Hydrochloric acid is a strong inorganic acid widely used chemical. The largest end uses for hydrochloric acid are steel pickling, oil well acidizing, food manufacturing, producing calcium chloride, and ore processing.

Formula: HCl

Molar mass: 36.46 g/mol

Appearance: Colourless, transparent liquid

It is a simple diatomic molecule consisting of a hydrogen atom and a chlorine atom connected with a covalent single bond. Since the chlorine atom is much more electronegative than the hydrogen atom, the covalent bond between the atoms is polar.

When dissolved in water, toxic hydrogen chloride gas will completely dissociate into its constituent ions to form hydrochloric acid. Aqueous HCl has water-like fluidity, color and appearance unless impurities such as iron (III) chloride are present that cause the solution to turn slightly yellow. Hydrochloric acid has a sharp, pungent, quickly-irritating odor that increases in potency and hazard with rising solution concentrations.

PRODUCTION OF AMINO ACID FROM CASSAVA

Amino acid

Amino acids are the main components of protein, protein are found in all living organism and play an important role in living cells. Approximately 20 amino acids are the common constituents of protein.

The general formula of an amino acid is

All of the amino acids, except glycine have two optically active isomers symbolized by D-or L-before their names.

Amino Acids are the main components of the elementary nutrients of living organism. There are eight and possibly ten, amino acids that are essential for existence and must be ingested through food. The Nutritional value of protein is governed by the Quantitative and qualitative balance of individual essential amino acid.

Protein is metabolized continuously by all living organism and are in dynamic equilibrium in living cell.

An organic acid containing both a basic amino group (NH₂) on dipolar ions. The 25 amino acid that have been established as protein constituent, are a amino acid (i.e. the -NH₂ group is attached to the carbon atom next to the L series), many other amino acids occur in the free state in plant or animal tissue 22 amino acid with structures identical with those that exist today have been identified in the pre-cambrian sedimentary rock indicating their presence atleast 3 million years ago. Amino acid are the main components of protein (qv.). Proteins are found in all living organisms and play an important role in living cells. Approximately 20 amino acids are the common constituents of proteins. Braconnot in 1820 isolated the simplest amino acid, glycine, from gelatin, the most recent one of nutritional importance is L-threonine which was found by rose in 1935 to a growth factor of rats. The presence of many uncommon amino acids has been reported in various living metabolites,

such as antibiotics, some other microbiological products and in non-proteinaceous substances of animals and plants, plant amino acid have been review recently by Bell. There are eight and possibly ten, amino acids that are essential for existence and must be ingested through food. The nutritional value of proteins is governed by the quantitative and qualitative balance of individual essential amino acids. It has been clearly shown that the nutritional value of a protein can be improved by the addition of amino acids absent in that protein. Most of the amino acids absorbed through the digestion of proteins are used to replace body proteins. The remaining portion is metabolized into various bio-active substance such as hormones, purine and pyrimidine bases, the precursors of DNA, RNA and other nucleotides, or is consumed as a energy source.

The history of amino acid discoveries is closely related to advances in analytical methods initially, quantitative and qualitative analysis depended exclusively upon crystallization from protein hydrolysates. The quantitative precipitation of several basic amino acids including phosphotungstates, the separation of amino acid esters by vacuum distillation and precipitation by sulfuric acid derivatives were developed successively during the last century. After World War II, analytical methods for amino acids were improved and new methods were introduced. The first was the microbiological assay using a lactic acid bacterium which requires all of the regular amino acids for its growth. This method is still used for the microdetermination of amino acids. Later, chromatographic separation using filter paper, ion exchange resins and other absorbents were rapidly developed. Twenty years ago all L-amino acids from the synthesized racemic mixtures. Since 1956, methods of production of L-amino acid have changed extensively. The first important change was made by kinoshita and co-workers who invented a new fermentation process using corynebacterium glutamicum bacteria to produce many other amino acids.

ALKYD RESINS

Alkyd resins have been defined as the reaction product of polyhydric alcohols and polybasic acids. This definition includes polyester resins of which alkyds are a particular type. The specific definition that has gained wide acceptance is that alkyds are polyesters modified with mono-basic fatty acids. In recent years, the term nonoil or oil-free alkyd has come into wide use to describe polyesters formed by the reaction of polybasic acids with excess polyhydric alcohols. These products are best described as hydroxylated polyesters and they are finding increasing use in the coatings industry.

Classification:- There are many ways of expressing the composition of an alkyd and those in general use are often misleading in that they do not specify the alkyd. The most common compositions expressed are (a) alkyd ratio or polyhydric alcohol/phthallic ratio (b) oil length or percent oil (c) percent phthallic. If the three common components, glycerol, fatty acids and phthallic/anhydride, react in equimolar proportions to a low acid number, the individual molecules are undoubtedly mixed esters and consequently, there is very little free glycerol phthalate or free fatty acid triglyceride.

The alkyds, as finished solutions, are ready for cold blending with other resins or polymer solutions for use in clear finishes, or for use as vehicles in which to grind pigments prior to blending with other resin or polymer solutions for use in clear finishes; or for grinding with pigments to form finished alkyd paints. More than 90% of the alkyds produced are handled in one of these ways to produce some type of paint, varnish, or lacquer for industrial or home consumption. About half of the alkyds made are sold by their producers to others who carry out the final operations of manufacture of paint or other coating material.

FATTY ACID FROM PALM OIL

OLEOCHEMICALS

Oleo Chemicals are chemicals derived from Plant and Animal Fats. They are analogous to petrochemicals derived from petroleum. The formation of basic oleochemical substances like Fatty Acids, Fatty Acid Methyl Esters (FAME), Fatty Alcohols, Fatty Amines and Glycerol are by various chemical and enzymatic reactions.

Fatty Acids

Fatty acids are basic oleochemicals, formed through the splitting of vegetable oils into fatty acids and glycerin. The refined fatty acids are used in production of natural chemicals, which in turn are used in the manufacturing of paper chemicals, lubricants, detergents, plastics, and more. Fatty acids may also be used in the production of tires and candles.

This section will concentrate on Fatty Acids produced from natural fats and oils (i.e. not those derived from petroleum products). Firstly though, we will recap briefly on Nomenclature. We spent some time clarifying the structure of oleochemicals and we saw how carbon atoms link together to form carbon chains of varying length (usually even numbered in nature, although animal fats from ruminant animals can have odd-numbered chains).

A fatty acid has at least one carboxyl group (a carbon attached to two oxygens (-O) and a hydrogen (-H), usually represented as -COOH in shorthand) appended to the carbon chain (the last carbon in the chain being the one that the oxygen and hydrogen inhabit). We will only be talking about chains with one carboxyl group attached (generally called "monocarboxylic acids").

The acids can be named in many ways, which can be confusing, so we will try and keep it as simple as possible. The table opposite shows the acid designations as either the "length of the carbon chain" or the "common name".

SYRINGE AND CATHETER

Disposable Syringe is an instrument which is used for injecting any liquid into the body of human beings or of animals. It consists of a cylinder and an air tight piston. These syringes are used for injecting the medicine into the body or into the nerve of the body which are not possible to take in through mouth or takes much time in mixing with blood.

These syringes are available in sizes varying from 2 C.C. to 100 C.C. Most popular and commonly used sizes are 2 C.C., and 5 C.C. Other sizes are also frequently used but upto lesser extent. In this project, we are manufacturing the disposable syringes with the sizes are 3 ml, 5 ml, 10 ml, 20 ml. and 50 ml.

Previously glass was used for making these syringes; the most commonly used glass is Pyrex glass. This glass is shock-resistant, temperature-resistant and has low thermal co-efficient of expansion. But with the development of plastic technology, this glass has been substituted by high grade plastics. Plastic can be used in place of glass for making syringes without any problem.

Plastic syringes are becoming more popular in the medical world due to its lower cost and higher accuracy. To test the efficiency of a syringe, close the tip with a finger and attempt to withdraw the plunger or piston. If the plunger and barrel fit perfectly, the vacuum created in the cylinder will prevent withdrawal of the plunger. The plunger should not be pulled to return rapidly due to the vacuum created or the barrel may be cracked.

With the development of pharmaceutical industries the use of syringes has also developed. About 70% pharmaceutical industries are in small scale sector. The output of the small scale sector covers a wide spectrum of formulations, which includes antibiotics vitamins, anti T.B. drugs, antidiarrhoeal drugs, anti-rheumatics, haematinics, hormonal preparations, tranquilizers, analgesics and anti-phyretics. Indeed this is a very wider range of product mix. About 50 percent of the above listed drugs are injectable and for that purpose syringes are required.

Disposable Syringes are being used by doctors to inject medicines through intravenous or intramuscular ways for the treatment of diseases & also by research & development personnel. Disposable syringes are made of plastic material and are used in the field of medical and veterinary science. Due to their availability in sterilized condition, ready to use, and cost effectiveness, disposable syringes are fast replacing the age-old glass syringes. Moreover, the horror of AIDS worldwide has almost dispensed with the reuse of syringes and the demand of disposable syringes has increased phenomenally.

Disposable syringes are mostly injection moulded from polypropylene. Syringes are available in sizes of 1 ml, 2 ml, 5 ml and 10 ml, 50ml in a variety of designs and consist of either two or three components construction. The number and size of injection moulding machines required depend upon syringe construction, number of mould cavities, annual production.

Disposable Syringes made of plastic Material have been successfully used in medical and pharmaceutical practice for many years. The constantly increasing use of this type Syringe indicates its importance. Which is based mainly on the advantages it offers regarding cost and hygienic applications.

The manufacture of plastic syringes has been developed to such a degree that the products now satisfy the requirements and standards set by Hospital and physicians. At the same time they offer the best possible technique of application to the physician and the highest possible degree of safety to the patient.

A catheter is a flexible tube made of latex, silicone, or Teflon that can be inserted into the body creating a channel for the passage of fluid or the entry of a medical device. For many years, the epidermal catheters used were plain tubes made of available industrial compounds, and design was largely based on current need. In the 1950s and early 1960s, a very common practice was to cut a suitable length of industrial polyvinyl chloride (PVC) or nylon tubing and have it sterilized with the other surgical equipment. Nowadays, there are many specialized catheter designs. For example, specific catheter designs allow catheters to be used in pulmonary, cardiac (vascular), neonatal, central nervous system, and epidural tissues. Catheters are designed to perform tissue ablation (tissue removal) and even serve as conduits for thermal, optics, and various medical devices.

The three major types of catheters are coronary, renal, and infusion. Coronary catheters are used for angiography (x-ray of blood vessels after injection of radiopaque substance), angioplasty (altering the structure of a vessel), and ultrasound procedures in the heart or in peripheral veins and arteries. The best-known renal catheters are Foley catheters, which have been commercially available since the 1930s.
