PROFITABL E INDUSTRI

#### ALUMINIUM EXTRUSION PLANT [EIRI-1921]

Aluminum extrusion is a technique used to transform aluminum allov into objects with a definitive cross-sectional profile for a wide range of uses. The extrusion process makes the most of aluminum's unique combination of physical characteristics. Its malleability allows it to be easily machined and cast, and yet aluminum is one third the density and stiffness of steel so the resulting products offer strength and stability, particularly when alloyed with other metals

#### COST ESTIMATION

#### MILK PROCESSING PLANT (PASTEURIZED MILK, FLAVOURED MILK, PLAIN DAHI & MISTI DAHI) [EIRI-1802]

Milk is an important human food. It is palatable easy to digest and highly nutritive. It contains proteins, fat, sugar, minerals and a liberal quantity of different kinds of vitamins. In World milk production, India ranks next only to the United States of America and the U.S.S.R. But the milk produced in India is far from adequate for its vast population as the daily average consumption per head comes to even less than half of the optimum requirement of about 310 grams.

#### **TENDER COCONUT WATER &** SUGARCANE JUICE IN PET BOTTLES [EIRI-1832]

Sugarcane juice in PET Bottles must be a demandable product as there are few units which are producing mango juice, guava juice, mixed juice and orange juice in PET Bottless but not sugar cane. PET Bottles sugar cane juice will fetch the good market as this is a new concept for our country. Preservation is done when Juice or food is kept for longer period without any deteriorated or spoils the juice by the direct contact with atmosphere. Juices are spoiled by decomposition due to aqueous content in the Juice itself and oxygen and other gases plus moisture in the atmosphere. This content provides healthy condition for micro organisms to growth which spoils the food. The oxygen present in atmosphere or air also helps the microorganisms to grow.

#### **DI CALCIUM PHOSPHATE** (ANIMAL FEED GRADE) FROM HYDROCHLORIC ACID ROUTE [EIRI-1854]

Rock phosphate is the source from which dicalcium phosphate can be manufactured. It finds applicability as a fertilizer and animal feed. The phosphours pentoxide content ranges around 41-42% in the dihydrate form. The trade mark for a dentrifice grade dicalcium phosphate dihydrate is captioned as "Dicalcium phosphate victor". It is CaHPO4.2H2O plus additive. FCC grade, Which is used as polishing agent in dentrifices. In the shallow, medium and deep-black soils having the carbonate content from 3 to 6%. the available phosphorous was highest at 60 days when superphosphate was applied. whereas in the alluvial soil containing 1% carbonate, the highest available phosphorous was observed at 60 days when the fertilizer applied was dicalcium phosphate.

#### LIQUID CALCIUM AND **MINERAL MIXTURE FOR** CATTLE FEED [EIRI-1875]

India possesses an enormous cattle (180 million) and buffalo (61 million) population but the annual milk production has reached only about 30 million tones. The low milk production is primarily dur to the poor potential of the animal and the lack of adequate nutrition. For the fullest exploitation of their genetic potentialities, better feeding must go hand in hand with better breeding. The principal feed resources for animal consumption in the country are crop residues like strows of wheat rice and other cereals and stovers which are very poor in feed value. Even these ate in short supply. These are supplemented to some extent by relatively better quality fodders like cultivated leguminous and non liguminous fodder grasses and concentrates. The latter are formulated largely from agro-industrial byproduct and forest wastes and small quantities of low-grade cereals with the present stock of feed and fodder resources available in the country, it is well impossible to meet the nutrient requirements of even the present day lowproducing cattle and buffaloas such a situation is bound to aggravate difficulties in the feeding of better producing livestock such as cross bred lows in exploiting their full genetic potentiality for early growth, better reproduction and higher milk production

#### **COLD SUPPLY CHAIN (FRUITS** & VEGETABLES PICK-UP, SORTING ETC.) [EIRI-1878]

More than 52 percent of India's land is cultivable, compared to the global average of

11 percent. Each year, India produces 63.5 million tons of fruits and 125.89 million tons of vegetables. India is also the largest produce of milk (105 million metric tons per year). India produces 6.5 million tons of meat and poultry as well as 6.1 million tons of fish a year. The perishable products transaction volume is estimated to be around 230 million metric tons Although India has the potential to become one of the world's major food suppliers, the country's inefficient cold chain network results in spoilage of almost 40 percent of its total agricultural production. The total value of the cold chain industry is estimated to be as high as USD 3 billion and growing at 20-25 per cent a year. The total value is expected to reach USD 8 billion by 2015 through increased investments, modernization of existing facilities and establishment of new ventures via private and government partnerships

#### DRY MORTAR MIX [EIRI-1909]

Dry Mortar Mix is gaining eminence in moderr times owing to its versatile superiority in regard to characteristics over the conventional in-situ mortars viz. better performance easy to uses easy to set and the quality of leaving no crakes and voiles. Besides it has preferably better and wider field of application as patching & repairing materials for plasting purposes and other construction works viz internal/external plastering masonry work etc. It is a very good substitute for conventional in-situ mortars. Various types of Ready mix dry mortar comprise internal plaster mortar, external plaster mortar masonry mortar, quick setting nortar high strength mortar repair mortar self leaving flooring mortar pre-mix RCC mortar etc. One specific advantage regarding manufacture of these ready mix dry mortar is that they can be manufactured in a single unit by variation in composition proportions as per different ormulations. Ready mix dry mortar is particularly useful on congested siles or in road construction where little space for the mixing plant and for extensive aggregate stockpile is

#### LEAD ACID BATTERY

Lead-Acid Battery comprises number of cells in a container. These cells contain positive (PbO2) and negative (Pb) electrodes or plates separators to keep the plate apart and sulphuric acid electrolyte. The electrochemical system is highly reversible and sulphuric acid electrolyte. The electrochhemical system is highly reversible and can be discharged and charge repeatedly before failure of some sort causes the chargocyde to be impractical. There are numerous battery designs. The most widely used secondary battery is the lead acid type. This battery is available in many sizes and capacities, and the weight can vary from 100g to several tons, There on three principal categories. The material used for containers used depends on the application e.g. polypropylene and vulcanized rubber for automotive batteries, polystyrene for stationery batteries, polycarbonate for a large single cell Cost Estimation

MANGANESE ORE JIGGING PLANT

Manganese is one of the most important W.C. for 1 Months strategic minerals, being the one which the greatest tonnages are required, and also the one in which the United States has had a limited Break Even Point

production, Manganese is an absolute necessity in the steel industry, as this industry uses about 14 pounds of manganese in every ton of steel produced. Annual statistics show that over 90 percent of the annual amount of manganese consumed in the United States goes into the production of steel. From this it can therefore be seen that the stability and accessibility of a steady supply of manganese ore is a controlling factor in the maintenance of the steel industry. The remaining 10 percent of the manganese consumed yearly in the United States is used in the manufacture of dry batteries, chemicals, glass, tile and brick. One of the outstanding characteristics of the utilization of manganese in steel making is that in the process of being used, most of the metal is dissipated into the slag in a form not readily susceptible to subsequent recovery as a secondary metal. In fact, the amounts that are returned to use in this way are so small as to be practically negligible and the full requirements for each year must be net from new mine production.

#### SODA ASH PLANT (FROM SOLUTION BRINE)

Sodium carbonate is a common inorganic industrial chemical, also known as soda ash (Na2CO3). It is widely used in the manufacture of glass, chemicals, such as sodium silicates and sodium phosphates, the pulp and paper industries, the manufacture of detergents and for the treatment of water. Soda ash manufacture by Solvay technology is a very complex process. The natural sodium chloride solution (brine) is extracted and purified (removal of solid impurities by filtration and removal of calcium and magnesium ions by precipitation). The discovery of the chemistry of the ammonia-soda process can be traced back to the early 1800s. A few British and French plants operated in 1840-1860, but without success. The ammonia-soda process is usually called the Solvay process because in 1865 Ernest Solvay started the first really

1 Ton./Day in 1865 Ernest Solvay started the first really Rs. 82 Lacs successful plant at couillet in Belgium. In 1874, Rs. 43 Lacs the first successful ammonia-soda plant was erected in England. The ammonia-soda Rs. 1.79 Cr. process is the dominant technology used 51% throughout the world, hence this process is selected for production of soda ash.

#### **TECHNICAL TEXTILES**

Technical textiles are textile material and products manufactured primarily for their performance and functional properties rather then aesthetic or decorative purpose. Aesthetic properties are not much important for the Technical Textiles. The performance and functional properties are in sense with the agri to aerospace application. Based on the end uses, fibre selection to the method of processing are the keys to new product development in the textile arena. Over all growth rates of Technical Textiles in the world are about 4.0% per annum but the apparel and home textiles are at the rate of 1.0%. Technical textiles application cycle is shown in the figure 1, it gives a vivid picture on the divisions of the technical textiles, which is a self-explanatory

#### M.S. BILLET CASTING FROM SCRAP AND SPONGE IRON USING INDUCTION FURNACE

The Induction furnace based on mini steel plan is a versatile installations where provisions are available for producing a range of steel products by Alloying and casting into various shape. The products of steel plants are in the form of Ingots, Billets, Sheets etc. These Induction furnace based steel casting units are suitable for small scale industries and medium scale industries and yet have the capability to

complete in the internal as well as international market at all counts. In mini Billets are the basic Plant products of steel from which different types of steel products are made such as sheets, W.C. Angles, Channels, Rods, etc. Mild steel Billets Total are the basic raw material for manufacturing Rate various types of re-rolled products. Mild steel Brea billets are used for mechanical engineering works such as manufacturing machines and their parts. Steel billets are used for production of plate, sheets, strips, rod etc. by hot Rolling and cold Rolling process. It is the commercial forms of steels mill products which are directly used in the Engineering Industries. However, is the steel billets is the first form of steel for producing other shapes by rolling, forging or extrusion process. The Industries of this type in SSI or medium scale have a wide spread immediate and future uses and applications which can at certain occasions reduce to some extent but can not be eliminated come what may plastics are certainly trying every best to replaced steel strips/sheets and of course, have succeeded in certain Areas to be considered a substitute but it has always been from just a few counted angles. If it is looked upon in every details it will be found that steels have substitute in wider senses so far.

#### **RUBBER PLANTATION**

Rubber is traditionally grown in India in the hinterlands of the South West Coast comprising of the state of Kerala and adjoining Kanyakumari District of Tamilnadu. This tract is, however, now reaching a level of saturation for rubber cultivation and the scope of further expansion of the crop is very much limited. Considering this fact, the expansion of rubber cultivation, which is of prime importance for setting up rubber production, has to take place mainly in non-traditional areas. Non-traditional areas so far identified as almost fully or marginally suitable for rubber cultivation are Arunachal Pradesh, Assam, Manipur, Iower reaches of hills of Meghalava Mizoram Nagaland and Tripura excluding the other state of India. Although the North Eastern Region lies far outside the traditional rubber growing zone, the agro-climatic conditions obtained here are unique in as much as near tropical features are experienced in most parts owing to low elevations, exposure to monsoons and other moderating influences. Public Sector Corporations set up later joined rubber planting La endeavours on extensive scales. Thus while in Р Assam and Tripura, Public Sector Corporations W are leading in the rubber plantation sector, in Т Meghalaya, Manipur, Mizoram and Arunachal R Pradesh the role has played by the State Forest B and Soil Conservation Departments. Individual growers are also contributing to fast growth of rubber cultivation in this region.

#### **CP BATH FITTINGS**

This project proposes to manufacture chrome plated sanitary fittings eg., Bib cocks, Pillar cocks, stop cocks, Bottle trap, Basin waste, Basin mixer, Angular stop cock, showers Introducer, and ceramic Disc with Quarter-turn fittings in single lever, etc. These are products of ordinary to sophisticated types. The Govt. of India has reserved this project for SSI Units in order to protect entrepreneurs from competition with large scale manufacturers. All the plant and machinery required for the project are indigenously available. These products are used as fittings in any Sanitary system. There is a large demand of chrome-plated bathroom fittings in all modern houses, offices, Hotels Railway Stations, Aerodromes & so on all over India.

#### STEEL TRANSMISSION LINE TOWER AND ROLLING MILL TO PRODUCE STEEL SECTIONS

The transmission line towers are comparatively light structures and the maximum wind pressure is the main criterion for their design The concurrence of earth quake & intensified wind pressures may also be considered in the earth quake - prone areas for design of the overhead transmission line towers. These towers are fabricated by means of bolted joints only. The structural steels of well specified quality only are used in construction of transmission line towers to ensure the permissible stresses and other design details Practices followed in material selection design fabrication, testing and must suit the field conditions of this country. Various design considerations are adopted in the design of self-supporting steel lattice towers for overhead transmission lines, including loads combination of loads, permissible stresses wind pressures likely to be experienced during service and atmospheric corrosion intensity.

#### FERRO SILICON (FROM MINERAL INGREDIENTS)

Ferro alloys are used in making alloy steels and castings of different special types as addition agents. Ferro alloys are usually made in electric-are furnaces. Alloy steel have often greater limitations on tramp element concentrations than plain carbon steels. Municipal ferrows scraps is largely used as part of the furnace charge to produce ferro alloys. Incinerated scrap is preferred because all of the consuminats are eleminiated though this source leaves a significant proportion of tin & copper impurities, yes due to the fact that ferro alloy is typically only a small addition to the final steel, the dilution of impurities, contained in the ferro alloy, results in acceptable concentrations. In steel making, various elements are added to the molten metal to effect various properties, eq. deoxidasion grain controly improvement of mechanical/thermal/ corrosion properties etc. Chemicals added into steels in the bath consists of iron and the elements intended to be incorporated, hence called ferroalloys. These ferro alloys are produced in electric & many other types of furnaces. A number of ferro alloys produced today contain very little of iron. Ferro alloys are, thus, a special class of addition agents.

#### **CATIONIC SOFTENER** (STEARIC ACID BASED)

Softening agents are surface active agents with a long hydrophobic chain and a shorter hydrophilic water-solubilizing group. The former determines the softening character and generally differs in properties from those of detergents. The type of ionic charge on a softening agent exerts a great influence on its orientation on textile material. Softening of textile materials was probably carried out in prehistoric times and has continued till today. Most of the Softening agents are derived from straight chain fatty radicals containing 12 to 18 carbon atoms. In textile finishing articles, the past decade can be considered "the age of the acrylics" and the era of the multipurpose finish. Numerous polymers farmed from acrylic monomers have been specially 'Tailored' to meet the finisher exacting requirements. Multipurpose finished have been big property wise & economy wise.

### **PEPPERMINT CULTIVATION** & PROCESSING

Consists of menthol (not less than 50%) extens of menthol pinene, limonene, cineole, menthone etc. It is derived by distilling the leaves and flavoring tops of the peppermint plant. The commercial cultivation of the plants known as peppermint and spearmint, members of the genus Mentha and the extraction, processing and shipment of their oils, includind menthol crystals, constitute an industry involving over \$100 million in transaction each year. The mint plsnts are perennials veilding aromatic oils which are increasingly importance and have indeed long been amongst the world's most valuable flavouring materials. Mint is probably the world's third most important flavour, being exceeded in popularity only by vanilla and citrus flavours. The oils obtained by the relatively simple process of steam distillation belong to a chemical class of plant products variably referred to as essential, volatile or ethereal oils, whose chemical composition consists almost entirely of hydrocarbon and oxygenated compounds known as terpenoids.

#### SILICON FROM RICE HUSK

Rice husk is a by product of agriculture a by product while is almost treated like waste and not seriously bothered about Consider, India's case every year about 60 million tonnes of paddy grown in the country produces upto 12 million tons of rice husk in over 900,000 rice mills spread around the country. Though, most of it is used as either a heating medium or as an animal feed. The strange fact is that 12 million tons of rice husk can have a heat value equivalent to around 20 million barrels of oil. To be more precise 3 kgs. of rice husk are equivalent to one litre of oil or 1.5 kilos of coal in heat content. Rice husk basically consists of a mixture of moisture Carbon. Volatiles. Ash and silica in ash. Its net heating value is between 3010 and 3340 kilo calories per Ko more over rice husk has low in cineration properties because of its silica modular shape and its light weight. In furnace rice husk produces heat efficiency and in special type vertical it will produce heat of 95% efficiency **Cost Estimation** Plant Capacity 5 Land & Building (3000 sq.mt.)

#### **RECLAMATION OF USED** ENGINE OIL (BY CLAY AND VACUUM DISTILLATION PROCESS)

Now-a-days engine oil has become an important factor for automobile and other purposes and since the prices of all petroleum products have gone up. It has become extremely necessary to refine used engine oil which could be reused as original. Keeping this view Defence Research (Materials), Kanpur has developed a very simple process which envisages utilization of sulphuric acid, activated clay and filter aid as the raw materials and the suggested reclaimed economical unit for this industry is 200 tons per annum. Engine oil becomes contaminated with foreign material in service. In circulating systems, where a substantial quantity of oil is involved, it is desirable to maintain it as clean as possible to provide maximum working efficiency and to keep wear and damage of lubricated parts to a minimum.

#### HDPE PIPES (1 INCH TO 24 INCH OD)

Provision of drinking water supply, or in other words 'piped' water supply to urban and rural population, constitutes an important aspect of developmental programmes in many countries. Among several materials for pipes and fittings plastics, though of recent origin, have offered vast potentialities both economical and technical, for exploitation by the engineers architects and builders of the plastic materials polyethylene (low and high density) and unplastic. These HDPE pipes and fittings have a high degree of corrosion a high degree of corrosion resitance, are light in weight. Yet tough and durable, have excellent, hydraulic properties, excellent thermal properties, weatherability. As such law & high density pipes are various fields viz. agriculture industry. With their many advantages over conventional materials, plastics have revolutionized modern engineering, unlike steel and copper, plastic materials do not corrode, are much lighter and cost less

#### N-ACETYL THIOZOLIDINE-4-**CARBOXYLIE ACID (NATCA)**

N-Acetyl Thiozolidine-4-Carboxylic Acid (NATCA) is a versatile chemical, used in agriculture as a plant growth substance used as a fruit setter, bio stimulant germination enhancer. The use of plant growth substance may be caused of the most important quantitative yield yet achieved in agriculture. The principal aim of the agro chemical industry has been to provide chemicals that controls the competition to the crop. Plant growth substance on regulators are used to modify the crop by changing the rate or pattern or both, of its response to the internal and external factor, that govern all stages of crop development from germination through vegetable growth reproductive development maturity and senescance or aging as well as postharvest preservation.

#### PRODUCTION OF ALL TYPES **OF FANS SUCH AS AXIAL** FANS, CENTRIFUGAL FANS (SMOKE EXTRACT FANS & FRESH AIR SUPPLY FANS), BATH ROOM FANS ETC.

Fans and blowers provide air for ventilation and industrial process requirements. Fans generate a pressure to move air (or gases) against a resistance caused by ducts, dampers, or other components in a fan system. The fan rotor receives energy from a rotating shaft and transmits it to the air. Difference between Fans Blowers and Compressors Fans, blowers and compressors are differentiated by the method used to move the air, and by the system pressure they must operate against.

#### **ACTIVATED CARBON** FROM RICE HUSK

The term Activated carbon, active carbon, or active charcoal is usually applied to amorphous carbons possessing higher absorption capacities than wood or animal charcoal. Many processes were developed during world war for the production of effective absorbents for use in gas masks. Industrial activated carbons in the form of pellets, granules or fine powders, and with many industrial applications, are now available in the market under different trade names. Commercial absorbent carbons may be grouped into decolorizing, gas absorbent, metal absorbent, and medicinal carbons according to their physical structure, properties, and applications. **Cost Estimation**

#### **ONION DEHYDRATION**

Dehydrated vegetables are being increasingly used as they retain their culinary quality and palatability and bring about economy in storage space and transport cost. Besides, there is optimum utilization of the product during the glut season, and saving of packaging material and tinplate. Dehvdrated onion is used extensively in overseas countries as a condiment. Efforts are also being made for export of dehydrated onions, which is being produced by several manufacturers. This standard is intended to help in the quality control of dehydrated Onion. Dehydrated Onions have been produced in small quantities since the nineteenth century is dehydrated onions were supplied to British naval expeditions in the mid-nineteenth century and dehydrated onions have been produced in sizable quantities during subsequent wars, primarily for consumption by armed forces, but also for civilian use.

#### STONE MINING

The quarry is the type of open pit mine, the rock or minerals are extracted from the guarry. For extracting building materials such as dimension stone, construction aggregate. riprap, sand and gravel; guarries are generally used. For the requirements for large amounts of aggregate in those materials, they are collocated with concrete and asphalt. The process of splitting the stones into usable shapes and different sizes for the process of building is known as stone quarrying. Stones from quarries have been used in all types of stone creations, and they are used in the process of constructions ranging from federal offices to farm foundations. In United States, stones quarries are classified into four major categories, they are boulder quarries, surface ledge quarries, commercial deep pit quarries, and subterranean quarries.

#### H.T. & L.T. INSULATOR, HT AIR BRAKE SWITCHES D.O. FUSE. LIGHTNING ARRESTERS

Materials having few free electrons poor conductors In fact, materials that have hardly any free electrons can be used to insulate electricity and are called insulators, as glass, mica, porcelain, rubber & paper. The function of an insulator is to insulate the line conductor from each other and from the pole or tower

head lines, namely. The pin insulator gets its name from the fact that it is supported on a pin. The pin holds the insulator, and the insulator has the conductor tied on it. Pin insulators are made of either glass or porcelain. The glass insulator is always one solid piece of glass, that is it is one piece insulator. The porcelain insulator is also a one piece insulator when used on low voltage lines but consists of two, three or four layers, cemented together to form a rigid until when used on higher voltage line. It is usually one piece for voltage below 23.000 volts. The use of several layers for high voltage line helps to spill the rain and provide a long, dry arc-over path. Pin insulator are seldom used on transmission lines having voltage above 4400 volts, although some 88000 volts, lines using pin insulators are in operation today

#### **PVC PIPES AND FITTING**

PVC pipe which is made from polymerized vinyl chloride, a synthetic resin, which when plasticized or softened with other chemicals has some rubber-like properties. Derived from acetylene and anhydrous hydrochloric acid PVC pipe has nominal sizes that are to be used with PVC socket fittings (schedule 40) and PVC socket or threaded fittings (schedule 80). PVC

Three colours of insulator are used in over | Pipe and Fittings have got tremendous demand in India as well as in abroad. To manufacture this, all the machinery and raw materials are available indigenously. A polyvinyl chloride (PVC) pipe is made from a plastic and viny combination material. The pipes are durable hard to damage, and long lasting. A PVC pipe does not rust, rot, or wear over time. For that reason, PVC piping is most commonly used ir water systems, underground wiring, and sewe lines

# Best Industries to Start and Grow

FAST FOOD RESTAURANT CHAIN WITH CENTRALLISED **KITCHEN** 

This document is developed to provide the entrepreneur with potential investment opportunity in setting up and operating a medium sized fast food restaurant offering a variety of food items to the general public. This pre-feasibility gives an insight into various aspects of planning, setting up and operating a fast food restaurant for the general populace. The document is designed to provide relevant details (including technical) to facilitate the entrepreneur in making the decision by providing various technological as well as business alternatives. The document also allows flexibility to change various project parameters to suit the needs of the entrepreneur. Fast food is food which is prepared and served quickly at outlets called fast-food restaurants. It is a multi-billion dollar industry which continues to grow rapidly in many countries.

#### GLASS REINFORCED GYPSUM MOULDING

The usual construction methods are now giving way to more specialized and efficient materials and techniques for construction. Constant innovation has helped the sector to come out with new techniques that help in quick and easy realization of projects. Prefabricated construction is not new , but it has suddenly gained importance seeing the demand for housing and infrastructure rising. With the conventional methods of construction using brick and mortar time consuming and not efficient, prefab construction proves to be a better and efficient alternative. Prefabricated structures are useful for sites where normal construction is not suitable like hilly regions flyover sites, and even commercial buildings.

#### QUARTZ BASED INDUSTRIES (QUARTZ POWDER, SILICA SAND, SILICA RAMMING MASS & FUSED SILICA)

Silica. The most common occurrence of silica (qv) is in the form of quartz. Other forms which are found in nature are tridymite, cristobalite, vitreous silica, cryptocrystalline forms (usually as pebbles in chalk), hydrated silica, and

diatomite. The principal sources of silica used in the ceramic industry are the sandstones quartzites, and sands. Quartzites, often called ganister, are firmly consolidated sandstones, whereas sandstones are rather lightly bonded quartz grains or sands. Silica is the primary ingredient in glass and is usually obtained from high purity sandstones or quartzites by crushing and grinding, or from high-grade sand deposits. The term glass sand may refer to a deposit of sand or, more commonly it is used to refer to the sand after it has been beneficiated from sandstones, quartzites, or natural sands

#### ANHYDROUS SODIUM **DITHIONITE PRODUCTION**

Sodium Hydrosulfite, also known as Sodium Dithionite had been developed at the beginning of the 20th century and was first applied for textile printing. Due to structural change in the textile industry, the importance of the application for the bleaching of wood pulp in the paper industry increased continuously. Sodium Hydrosulfite is a white powder. Commercial sodium hydrosulfite contains 85% 90% sodium dithionite w/w. It is readily soluble in water and shows powerful reducing action in aqueous solutions. Sodium hydrosulfite is used as a reducing agent in dying application. It undergoes reduction reaction with waterinsoluble vat dye and sulfur dye to form watersoluble alkali metal salt of the dye so that they have affinity for the textile fiber. **Cost Estimation**

#### MAHINDRA CAR DEALERSHIP WITH AUTOMOBILE SERVICE STATION/GARAGE

A Car dealership is a business that sales new or used cars at the retail lavel based on dealership contact with Auto maker. It employs automobiles sales people to sell their automobile vehicle. It may also provide maintenance service for car sand employs automobiles technicians to stock and sells spare automobile parts and process warranty claims. Mahindra & Mahindra (M&M) was established in 1945 as Mahindra & Mohammed. Later on, after the partition of India, one of the partners - Ghulam Mohammad - returned to Pakistan, where he became Finance Minister. As a result, the company was renamed to Mahindra &

Mahindra in 1948. M&M started its operation as a manufacturer of general-purpose utility vehicles. It assembled CKD ieeps in 1949. Over the passing years, the company expanded its business and started manufacturing light commercial vehicles (LCVs) and agricultural tractors. Apart from agricultural tractors and LCVs, Mahindra & Mahindra also showed its dexterity in manufacturing army vehicles.

Total Capital Investment	Rs. 3.83 Cr.
Rate of Return	27%
Break Even Point	67%
************************************	

#### **ABSORBENT COTTON &** SURGICAL BANDAGES (EOU)

Absorbent Cotton also known as Surgical Cotton or Cotton Wool is mainly used for medical purposes in hospitals, nursing homes dispensaries etc., Because of high fluid absorbency power, it is better known as absorbent cotton. The absorbent cotton should be chemically inert and soft to give maximum protection and should not cause irritation. . These properties can be achieved by manufacturing the product as per standard method of manufacture.

#### **Cost Estimation**

Plant Capacity	3 MT./Day
Land & Building (Area 5000 s	sq.mt.Rs. 5.19 Cr.
Plant & Machinery	Rs. 2.03 Cr.
W.C. for 1 Months	Rs. 66 Lacs
Total Capital Investment	Rs. 8.25 Cr.
Rate of Return	32%
Break Even Point	50%

Market Survey Cum Detailed Techno Economic Feasibility Reports

To get Loan/Finance from Banks/Finacial Institutes. To set up your own Industry/Unit

To have Detailed & Exhaustive Data on any Project.

\* EIRI Project Reports are prepared by highly qualified & experienced consultants & Market Research and Analysis supported by a panel of Experts and Computerised. Data provided are reliable and uptodate collected from manufacturers/suppliers, plant

A complete List of Industrial Project Reports are given on www.eiribooksandprojectreports.com

### EACH DETAILED PROJECT REPORT CONTAINS:

✓INTRODUCTION : Project Mix, Uses & Applications, Quality Control Measure & Their Introduction for Attaining Required Properties Economy & Productivity Competence.

✓MARKET SURVEY : Market Position, Installed Capacity Production, Anticipated Demand, Present Manufacturers, Statistics of Imports & Exports, Estimated Demand, Demand & Supply Gap (If available), LI/IL Issued Recently

◆PROCESS OF MANUFACTURE : Inventory Controls & Tests, Comparative Study of Process for Manufacturing the Product, Formulations, Process Flow Sheet Diagram, Process Detail in Stages from Raw Materials to Finished Products

◆RAW MATERIALS : Raw Material Specifications, Market Codes & Raw Material Prices, Sources of Procurement of Raw Materials [Imported/Indigenous]

◆LAND & BUILDING : Total Land Area Requirement with Rates, Covered Area Break-up with Estimated Costs of Construction

## For assessing Market Potential, Corporate Diversifications, Planning, Investment Decision Making and to start your own setup, Entrepreneurs and Industrialists are most welcome to contact EIRI. EIRI Technocrats and Engineers have just prepared "MARKET SURVEY CUM DETAILED TECHNO ECONOMIC FEASIBILITY REPORTS" on following lucrative products which are most viable and profitable and having bright future scope
