LPG CYLINDER VALVES MANUFACTURING PLANT [EIRI/3243]

Valves are a type of mechanical device that are implemented to regulate flow. pressure, or both, within a system. They an integral aspect of any piping system that requires a fair amount of control. The primary functions of a conventional valve comprise flow control in the form of rate of flow and the direction of flow. Valves are thus used to prevent back flow, and relieving pressure. The various valve types, designs, and models can be specific industrial, functional in commercial, and residential applications. LPG valves may need to be designed especially for maintaining high pressure within the cylinder and to let out the gas at a rate specified and within regulatory permission. These valves are also designed to withstand the possible damage they may take during transportation. An additional cap is often screwed over the valve in order to further reduce the likelihood of gas leakage when the cylinder is not in use. The gas cylinder valve is the primary safety mechanism on a gas cylinder and shall not be tampered with. It is a device used to contain the contents of the cylinder that is under pressure. Cylinder valves are fitted with pressure relief valves of different types (depending on the cylinder) to protect against catastrophic failure of the cylinder valve.

AUTO KNITTING UNIT WITH AUTO STRIPPER [EIRI/3244]

The apparel Knitting Industry may be divided into four branches knitted outerwear, knitted yard good knitted hosiery and knitted underwear knitted yard goods mills produce a wide variety of fabrics in either flat or circular farm that can be cut and sewn into apparel and other items. Those mills that produces outerwear, hosiery, or underwear may knit the item directly or may knit section of a garment that are sewn or cut and sewn together. Those mills complete the garment from knitting right through to constructions in the same mill. Knitted Fabric is made from one continuous varn or from a number of continuous yarns. Any fiber may be used and a variety of thick and thin yarns and textured and fancy varns can be put together. Spun and filament varns are both used. The advantages of Knit fabrics are that they are on the whole easier to sew than woven

They are comfortable to wear because they give with body less precise fitting in needed because of this elasticity and most knits are easier to care for than woven's Knitting is a method by which thread or yarn may be turned into cloth or other fine crafts. Knitted fabric consists of consecutive loops, called stitches. As each row progresses, a new loop is pulled through an existing loop. The active stitches are held on a needle until another loop can be passed through them. This process eventually results in a final product, often a garment. COST ESTIMATION

DENIM GARMENTS (DENIM CLOTH WILL BE PURCHASED FROM MARKET AND **CONVERTED TO GARMENTS**

WITH 50 MACHINES) [EIRI/3245]

The word `DENIM' is almost synonymously used for high fashion garments. 'DENIM' has become so popular throughout the world today that the moment this magic word is heard, it conjures up in one's mind visions of a blue garment with unique and elegant appearance. This classic fabric has been in use aross the world for a long time. However, the appearance of this fabric is continuously being modified to appeal to the varied fashion trends of different generations In many respects fashion trends have dictated how the fabrics and garments should look and accoordingly the processing techniques have been changed. Today, the consumer literally has numerous choices of unwashed and prewashed garments suit individual tastes.

RTS JUICE PLANT [EIRI/3246]

Juice is a beverage made from the extraction or pressing out of the natural liquid contained in fruit and vegetables can also refer to liquids that are flavored with these or other biological food source such as meat and seafood (e.g., clar juice). Juice is commonly consumed as beverage or used as an ingredient o flavoring in foods or other beverages such as smoothies. Juice emerged as popular beverage choice after the

development of pasteurization methods allowed for its preservation without using fermentation (the approach used with wine production). The Food and Agriculture Organization of the United Nations (FAO) estimated the total world production of citrus fruit juices to be 12,840,318 tons in 2012. The largest fruit juice consumers are New Zealand (nearly a cup, or 8 ounces, each day) and Colombia (more than three quarters of a cup each day). COST ESTIMATION

OPEN END SPINNING UNIT [EIRI/32471

Open end spinning is an excellent shortterm blending process. The presence of short fibers in the material fed does not seriously affect the efficiency of Open end spinning and it may be that process will have a bright future in the spinning of waste. Whenever the final judgment on open end spinning may be, it is a process that is here to say. Few innovations in the field of textiles have created such interest as open-end spinning. Despite the tremendous efforts that have been made over the years to further the development of ring spinning, it now seems to be generally accepted that, owing to mechanical, technological and above all economic limitations, the potential of that well established process has been virtually exhausted and that further advancement will only be achieved through an entirely new approach; it may be that Open-end spinning will be the answer. Spinning may be defined as the process of converting fibres and/or filaments(s) into yarn. In the production of manmade fibres, the extrusion of the fibre forming liquid through the spinners followed by hardening of this liquid iet in to solid filaments is called as the process of spinning. The meaning of the spinning in this case may be completely different from that used for natural fibres. Generally, we can define spinning as a process that produces a yarn as its final product. The spinning of manmade fibres can be carried out by three different processes:- Wet Spinning, Dry Spinning, Melt Spinning.

MANUFACTURING MEDICAL PLASTICS LIKE CATHETERS, SYRINGE, DEXTROSE SALINE (I.V. FLUID) IN PLASTIC BOTTLE, IV SET CANNULA AND RELATED

MATERIALS (CODE NO. 1995) There is a huge demand of Medical Plastics in India and abroad. Many items can be produces in this category. A catheter is a flexible tube made of latex. silicone, or Teflon that can be inserted into the body creating a channel for the passage of fluid or the entry of a medical device. For many years, the epidermal catheters used were plain tubes made of available industrial compounds, and design was largely based on current need In the 1950s and early 1960s, a very common practice was to cut a suitable length of industrial polyvinyl chloride (PVC) or nylon tubing and have it sterilized with the other surgical equipment. Nowadays, there are many specialized catheter designs. For example, specific catheter designs allow catheters to be used in pulmonary, cardiac (vascular), neonatal, central nervous system, and epidural tissues. Catheters are designed to perform tissue ablation (tissue removal) and even serve as conduits for thermal. optics, and various medical devices. The three major types of catheters are coronary, renal, and infusion. Coronary catheters are used for angiography (xray of blood vessels after injection of radiopaque substance), angioplasty (altering the structure of a vessel), and ultrasound procedures in the heart or in peripheral veins and arteries.

INVESTMENT CASTING (CODE NO.1994)

Ceramic Shell Investment Casting (CSIC) is one of the near net shape casting technologies. The process is based on expendable wax patterns for producing ioint-less moulds that are required for near net shape castings. The main difference between investment casting and ceramic shell investment casting is that, in the former process, before dewaxing the wax pattern, it is immersed in a refractory aggregate. Whereas in the ceramic shell investment casting, a ceramic shell gets built around the tree assembly through repeated dipping of the pattern into slurry (refractory material such as zircon with binder). After getting the required thickness of cross section, the tree assembly is de-waxed. The shell obtained

is further immersed in a refractory coating and the metal is poured into it. In this process, a wax pattern assembly is first dipped into a ceramic slurry bath for its primary coating. Thereafter, the pattern is withdrawn from the slurry and is manipulated to drain of the excess slurry to produce a uniform coating layer. COST ESTIMATION

AYURVEDIC AND UNANI PHARMACY [CODE NO.1992]

Ayurvedic system of medicine is as old as the Vedic age. Now-a-days people give preference to the Ayurvedic medicines as the allopathic medicines are costlier and have side effects. Ayurvedic medicines are based on plants, animals extract and minerals both in single ingredient drugs and compound formulations, however, Ayurveda does not rule out any substances from being used as a potential source of medicine. Ayurvedic compound formulations are mainly divided into two groups viz. (1) Kasthausadhi (predominantly plant drugs)

and (2). Rasausadhi (predominantly metals and minerals). There are several categories of Kasthausadhi formulations such as Asavaristra, Avleha, Grafa Churena, Taila etc. and of Rasausadhis such as Bhasma, Pisti, Lauha Kapibadkva, Rasayana etc. The Ayurvedic drugs are derived from vegetable sources from the various parts of the plant like root, leaf, flower, fruit extrude or plant as a whole. Ayurvedic system has its origin in antiquity in our country which has been dedicated to the cure of innumerable ailments.

RADIAL TYRE MANUFACTURING UNIT [CODE NO. 1990]

Tyres and tubes, the strategic rubber products and basic supplements to the automotive vehicles are of most importance to the country's economy The tyre industry sector is providing direct empolyment to over 40,000 people and indirect empolyment to lakhs of people. This industry sector is now being considered as a core industry sector. The manufacturing of automobile tyres as essential ancillary for the an development of automobile sector came into being in India during 1930's when the Dunlop India Ltd, the first tyre manufacturing transnational company started its operation in 1935 at Sahagan in West Bengal. Today, one cannot imagine a world without automobiles even though India has a large network of railway lines, considering the vastnes of the country and the thrust given for balanced development, road transport would have decisine role to play in the coming years. Vehicle would become more and more part of not only the commercial like but even the personal like. The Indian tyre and tube industry has been continuously in the process of up gradation of product quality to satisfy the requirements of Indian automotive manufactures, users of automobiles and the road conditions prevailing in the country.

However, In India, the industry is still immature and interconnections are not given to ordinary consumers in general. So you can use an Energy Storage Device to store Electricity. However Energy Storage Products like Chemical Batteries are quite expensive. Solar Panel produced Electricity usually costs between Rs. 15-18 /KwH (much higher than the Rs. 3-6/ unit paid normally) which makes if uneconomical except in special cases like off grid applications.

CALCIUM SILICATE [CODE NO. 2042]

shortened trade name Cal-Sil or Calsil) is the chemical compound Ca2SiO4, also known as calcium orthosilicate and sometimes formulated 2CaO.SiO2. It is one of a group of compounds obtained by reacting calcium oxide and silica in various ratios e.g. 3CaO+SiO2, Ca3SiO5; 2CaO•SiO2, Ca2SiO4; 3CaO•2SiO2, Ca3Si2O7 and CaO.SiO2, CaSiO3 Calcium silicate is a white free-flowing powder derived from limestone and diatomaceous earth. It has a low bulk density and high physical water absorption. It is used in roads, insulation, bricks, roof tiles, table salt and occurs in cements, where it is known as belite (or in cement chemist notation C2S). It is used as an anti-caking agent in food preparation and an antacid. It is approved by the United Nations' FAO and WHO bodies as a safe food additive in a large variety of products.

SURGICAL AND EXAMINATION HAND GLOVES (STERILE AND NON STERILE) (CODE NO. 2041)

Medical gloves are disposable gloves used during medical examinations and procedures that help prevent crosscontamination between caregivers and patients. Medical gloves are made of different polymers including latex, nitrile rubber, vinyl and neoprene; they come unpowdered, or powdered with cornstarch to lubricate the gloves, making them easier to put on the hands Cornstarch replaced tissue-irritating Lycopodium powder and talc, but even cornstarch can impede healing if it gets into tissues (as during surgery). As such, unpowdered gloves are used more often during surgery and other sensitive procedures. Due to the increasing rate of latex allergy among health professionals, and in the general population, gloves made of non-latex materials such as vinyl, nitrile rubber, or neoprene have become widely used.

PRODUCTION) (CODE NO. 2035) 1. An emulsion is a very fine dispersion of one liquid in another with which it is immiscible. 2. An emulsion is a system containing two liquid phases, one of which is dispersed as globules in the other. 3. Emulsions are mechanical mixtures of liquids that are immiscible under ordinary conditions, and which may be separated into layers on standing, heating, freezing, by agitation or the addition of other chemicals. 4. An emulsion is a twophase liquid system consisting of fairly coarse dispersions of one liquid in another with which it is it is not miscible. 5. Emulsions are intimate mixtures of two immiscible liquids, one of them being dispersed in the other in the form of fine droplets.

QUARTZ POWDER FROM

QUARTZ ROCK [CODE NO. 2034] The term 'quartz' is often referred to as a synonym for silica. Silica (SiO2) is one of the ubiquitous materials in the earth's crust. Quartz, quartz crystals, quartzite, silica sand, sand (others) and moulding sand are all coined together in one generic name 'silica minerals'. This is because all these commodities are essentially crystalline silicon dioxide (SiO2) with variations mostly related to their crystalline structure and presence of minor or trace impurities.

SANITARY NAPKINS (SEMI -

AUTOMATIC UNIT) [CODE 2033] Sanitary napkin is a hygiene absorbent product used by women during menstrual periods. It is a product of technical textile. A sanitary napkin, sanitary towel, sanitary pad, menstrual pad, maxi pad, or pad is an absorbent item worn by a woman while she is menstruating, recovering from vaginal surgery, for lochia (post birth bleeding), abortion, or any other situation where it is necessary to absorb a flow of blood from a woman's vagina. The menstrual cycle stars for young women

between the ages 11-17, frequently around 12-13 years. On average a woman experiences a period every 28th day, 12-13 times in a year. A menstrual period normally lasts 3-7 days. The loss of fluid in a period is on average half a cup or 65-80 ml. On small scale, the processed cotton is purchased which is spinned and woren. Sanitary napkin is a product used by women during the menstrual period to treat menstruation. It is one of the daily necessities for women.

ACTIVATED CARBON FROM COCONUT SHELL/WOOD/COAL & LIGNITE [CODE NO. 2032]

Carbon is probably the most widely distributed element in nature. It occurs in two allotropic crystalline forms viz. graphite (hexagonal system) and diamond (isomeric system), the former is soft and black while diamond is hard and transparent. Charcoal, coke and carbon black, classified as emorphous carbon: are considered by some to represent a third allotropic form. They are said to be composed of very minute crystals of graphite by others. Carbon is an essential constituent of all vegetable and animal matter in which it occurs in combination with hydrogen, nitrogen, oxygen and other elements in immense variety of compounds. In combination with hydrogen it occurs as hydrocarbons in petroleum It is also found in carbon dioxide in air (0.03% as sodium bicarbonate in sea water, and as calcium and magnesium carbonate in sedimentary rocks such as chalk and dolomite.

STAINLESS STEEL WIRE DRAWING [CODE NO. 2026]

Stainless steel wire is produced by colddrawn from stainless steel wire rod of appropriate composition through one or more carbide or diamond dies. reductions that must take place. The percent of reduction in cross-sectional area occurring at each die determines the extent of work hardening and dictates whether or not further reduction can take place prior to annealing. Annealing is required to soften the work-hardened wire per minute. Due to appearance, hardness, smoothness, non corrosiveness, and resistance to elevated temperatures stainless steel wire is required. COST ESTIMATION

The bulk of jute sack production is used for all types of jute bags. Sacking bags, woven wholly from jute fabrics, are available as plain and twill bags. Jute bags, the other name for sacking bags are mainly used to pack cement, sugar and other bulky articles, which are packed in weight range from 50 to 100kgs.

RUBBER POWDER [CODE NO.2023]

By the application of heat and chemical agents followed by intense mechanical working to ground vulcanized scrap or worn out rubber tires, tubes and waste rubber articles, a substantial regeneration on devulcanisation of the rubber compound to its original plastic state is effected, thus permitting the product to be compounded, processed and revulcanised. There are several types of rubber powder made in different ways. They may be lightly vulcanized and may contain appreciable quantities of anti-agglomerating agents to prevent massing on storage. The trend now-adays is towards automation in production of rubber goods during handling, mixing and processing. The powder forms of rubber is very easy to be handled. The advantages of powder processing have been recognized and include (a) rapid and inexpensive mixing ; (b) flexibility in compounding.

Since a large portion of maize crops are grown for purposes other than human consumption, rice is the most important grain with regard to human nutrition and caloric intake, providing more than one fifth of the calories consumed worldwide by the human species. The rice plant can grow to 1-1.8 m (3.3-5.9 ft) tall, occasionally more depending on the variety and soil fertility. Motorcycle tyres are the only contact between the motorcycle vehicle and the ground. The contact surface of a motorcycle tyre is generally very small compared to a tyre used for larger vehicles such as cars, lorries and trucks. Hence, it is particularly vital for the motorcycle tyre to have good traction performance, good rolling and abrasion resistance and high wear resistance. It is impossible to have all the preceding ideal
